Inositol 1,4,5-trisphosphate receptors (IP_3Rs) are tetrameric intracellular channels through which many extracellular stimuli initiate the Ca^{2+} signals that regulate diverse cellular responses. There is considerable interest in developing novel ligands of IP_3R . Adenophostin A (AdA) is a potent agonist of IP_3R and since some dimeric analogs of IP_3R ligands are more potent than the corresponding monomer, we considered whether dimeric AdA analogs might provide agonists with increased potency. We previously synthesized triazolophostin, in which a simple triazole replaced the adenine of AdA, and showed it be equipotent with AdA. Here, we used click chemistry to synthesize four homodimeric analogs of triazolophostin, connected by oligoethylene glycol chains of different length. We evaluated the potency of these analogs to release Ca^{2+} through type 1 IP_3R and established that the newly synthesized dimers are equipotent to AdA or triazolophostin.

Introduction

Inositol 1,4,5-trisphosphate (IP_3 , **1**, Fig. 1) is an important second messenger that evokes Ca^{2+} release from intracellular stores through its interaction with IP_3 receptors (IP_3R) in the endoplasmic reticulum.¹ IP_3R are large tetrameric proteins, within which IP_3 binding to each of the four subunits is required to initiate opening of the Ca^{2+} -permeable channel.² High-resolution structures of the IP_3 -binding core (IBC, residues 224–604) have defined the interactions of IP_3 with the IP_3R .³ More recently, structures of the N-terminal region (residues 1–604)⁴ alongside a structure of the complete IP_3R derived from cryo-electron microscopy have begun to suggest how IP_3 binding might trigger opening of the intrinsic pore of the IP_3R .⁵

There is continuing interest in the development of potent agonists and antagonists of IP_3R .⁶ The fungal metabolite, adenophostin A (AdA, **2**, Fig. 1), binds to IP_3R with greater affinity than IP_3 and it is more potent than IP_3 in evoking Ca^{2+} release.⁷ AdA analogs with a nucleobase or base-surrogate are also more potent than IP_3 .⁸ Molecular docking^{8j,m,9} and mutation studies¹⁰ suggest that a cation- π interaction between the adenine moiety of AdA and Arg504 within the IBC contributes to the increased affinity of AdA. We recently

reported synthesis of a library of active AdA analogs, triazolophostins, by using a click chemistry approach.¹¹ These potent analogs have substituted triazoles as adenine surrogates. The simplest analog, triazolophostin (**3**, Fig. 1) was equipotent with AdA.

Multimeric ligands often have greater affinity than monomeric ligands.¹² This can be due to simultaneous binding to more than one binding site or a statistical effect arising from the local increase in ligand concentration.¹³ The former is unlikely for IP_3R because the orientation of the IP_3 -binding sites within the tetrameric IP_3R is unlikely to allow simultaneous binding of two ligands linked by a short tether.^{4b,14}

Fig. 1 The structures of IP_3 (**1**), adenophostin A (**2**) and triazolophostin (**3**).

A few multimeric ligands of IP_3R have been reported. Before the location of the IP_3 -binding sites within IP_3R was known, clustered bi- and tetra-dentate analogs of ribophostin (**4**, Fig. 2A) were synthesized, anticipating that if the spacing

between the linked ligands was appropriate they might bind simultaneously to the four IP₃-binding sites.¹⁵ However, the potencies of the monomeric and polymeric ligands were rather similar. Several homodimeric¹⁶ and heterodimeric¹⁷ ligands of IP₃ (**5–10**, Fig. 2B), particularly those with short linkers, were shown to bind to IP₃R with increased affinity.^{13d} Very recently, dimers of 2-O-Bt-IP₄/IP₅ (**11**, Fig. 2C) were shown to be antagonists of IP₃Rs.¹⁸ These results demonstrate that dimeric IP₃R ligands can provide useful tools, some of which have greater affinity than the monomeric ligands. We therefore considered whether dimers of AdA might be more potent than AdA.

Results and discussion

As the synthesis of AdA dimers is challenging, we decided to make oligoethylene glycol-tethered dimers of triazolophostin (Fig. 3). We envisaged that use of click reaction¹⁹ with a linker connected to alkyne at both termini would ensure both formation of triazole and link the two monomers in one step. Previous studies suggested that short linkers were most likely to improve the affinity of homodimers.^{13d} We therefore selected spacers smaller than hexaethylene glycol. The linkers **14a–d** were synthesized by slightly modifying previously reported procedures.²⁰ The oligoethylene glycols were first co-evaporated with toluene and then treated with sodium hydride in the presence of excess propargyl bromide to get dipropargyl polyethylene glycols **14a–d** in good to excellent

yields. The azide **13** was synthesized from glucose and xylose by several protection-deprotection reactions followed by phosphorylation as reported earlier.¹¹ The azide **13** was then treated with dialkynyl polyethylene glycols **14a–d** in the presence of Cu(I) catalyst to get fully protected triazolophostin

Scheme 1 Synthesis of triazolophostin dimers. Reagents and conditions: (a) ref 11; (b) Cu, CuSO₄, H₂O:^tBuOH (1:1, v/v), rt, 24 h; (c) Pd(OH)₂/C, cyclohexene, MeOH:H₂O (10:1, v/v), 80 °C, 4 h; a, *n* = 2; b, *n* = 3; c, *n* = 4; d, *n* = 6.

dimers **15a-d** in good yields. The debenzoylation of protected triazolophostin dimers **15a-d** was carried out using transfer hydrogenolysis in the presence of palladium and cyclohexene under reflux condition and the products were purified by ion-exchange chromatography to yield dimers **12a-d**, in excellent yields (Scheme 1).

The dimeric ligands **12a-d** were screened for their abilities to evoke Ca^{2+} release through IP_3R (Table 1, Fig. 4). All four dimers were full agonists of IP_3R , more potent than IP_3 , but similar in their potency to AdA and the monomer, triazolophostin. The similar potencies of **12a-d** irrespective of their tether length suggest that these ligands might be interacting with $\text{IP}_3\text{R1}$ in monodentate fashion.

^aMaximal Ca^{2+} release, the half-maximally effective ligand concentration (EC_{50}), $-\log\text{EC}_{50}$ (pEC_{50}) and Hill coefficient (n_{H}) are shown as means \pm SEM ($n = 3$). ^bThe EC_{50} value of each ligand is also shown relative to that for IP_3 (**1**) ($\text{EC}_{50}^1/\text{EC}_{50}^{\text{analogue}}$).

Fig. 4 Summary of Ca^{2+} release from permeabilized DT40- $\text{IP}_3\text{R1}$ cells evoked by IP_3 , monomer **3** and its dimeric analogs **12a-d**.

Conclusions

In conclusion, based on several previous reports that dimeric IP_3R ligands can be more potent than the corresponding monomers, we anticipated that dimers of AdA might have increased potency. We used click chemistry to synthesize dimers of a potent analog of AdA (triazolophostin) linked by spacers of different length. In assays of Ca^{2+} release through IP_3R , the dimeric ligands were no more potent than the corresponding monomer (**3**). This suggests that whereas

dimeric derivatives of IP_3 have reduced efficacy but improved affinity,^{10,21} dimerization of AdA analogs does not improve their affinity.

Experimental Section

1. General methods

The chemicals were purchased from commercial sources and used as received. The TLC plates were visualized under UV light and by dipping plates into either phosphomolybdic acid in MeOH or sulphuric acid in ethanol, followed by heating. All NMR experiments were carried out on a 500 MHz NMR spectrometer and at room temperature. Tetramethylsilane (TMS, δ 0.0 ppm) or the solvent reference (CDCl_3 , δ 7.26 ppm; D_2O , δ 4.79 ppm) relative to TMS were used as the internal standard. The data are reported as follows: chemical shift in ppm (δ) (multiplicity [singlet (s), doublet (d), doublet of doublet (dd), triplet (t), quartet (q), and multiplet (m)], coupling constants [Hz], integration and peak identification). All NMR signals were assigned on the basis of ^1H NMR, ^{13}C NMR, COSY and HMQC experiments. ^{13}C NMR spectra were recorded with complete proton decoupling. Carbon chemical shifts are reported in ppm (δ) relative to TMS with the respective solvent resonance as the internal standard. The concentration of the compounds for ^1H NMR was 5 mg per 0.5 mL and for ^{13}C NMR it was 20 mg per 0.5 mL for protected compounds and 5–7 mg per 0.5 mL for final compounds in case of ^1H and ^{13}C NMR. Modified Brigg's phosphate assay²² was employed to quantify each triazolophostin **12a-d**. Silica gel 230–400 mesh was used to perform flash column chromatography.

2. General procedure for syntheses of fully protected triazolophostin dimers:

To a solution of azide **13** (0.144 mmol) and dialkynyl PEG **14a-d** (0.072) in $\text{H}_2\text{O}/^t\text{BuOH}$ (1/1, v/v, 2 mL) was added Cu (0.036 g, 0.57 mmol) and CuSO_4 (8 mg, 0.028 mmol) and stirred at room temperature for 24 h. The reaction was monitored by TLC. When the TLC showed complete disappearance of the azide **13**, the mixture was filtered through a Celite bed and was partitioned between ethyl acetate and water. The organic layer was washed with brine. The organic layer was dried over anhyd. sodium sulphate, filtered and concentrated under reduced pressure. The residue thus obtained was purified by flash column chromatography using a mixture of acetone, diethyl ether and petroleum ether (4:2:15 v/v/v) as eluent to get pure **15a-d** as a colourless gum.

a. Protected triazolophostin dimer **15a**:

Click reaction of azide **13** (0.2 g, 0.144 mmol) with diyne **14a** (0.011 g, 0.072 mmol) gave the protected dimer **15a** (0.18 g, 85%) as a colourless gum. ^1H NMR (500 MHz, CDCl_3) δ : 3.47–3.57 (m, 18H, H-2'', H-4'', H-6''_A and DEG-H), 3.73–3.75 (m, 2H, H-5''), 4.20–4.23 (m, 2H, PhCH_2), 4.27–4.32 (m, 8H, H-5'_A and PhCH_2), 4.30–4.45 (m, 10H, H-3', H-4', H-5'_B, H-6''_B and PhCH_2), 4.57–4.59 (m, 2H, PhCH_2), 4.63–4.66 (m, 4H, PhCH_2), 4.68–4.73

(m, 6H, PhCH₂), 4.80-4.93 (m, 16H, H-3'', H-4'' and PhCH₂), 5.11 (d, 2H, *J* = 3.2 Hz, H-1''), 5.26-5.28 (m, 2H, H-2') 6.24 (d, 2H, *J* = 5.0 Hz, H-1'), 7.00 (d, 4H, *J* = 7.0 Hz, Ar-H), 7.05-7.19 (m, 82H, Ar-H), 7.26 (d, 4H, *J* = 7.0 Hz, Ar-H), 7.60 (s, 2H, H-5); ¹³C NMR (125 MHz, CDCl₃) δ: 64.2, 68.3, 69.1, 69.2, 69.3, 69.5, 69.6, 69.7, 69.9, 70.1, 70.4, 71.9, 73.3, 73.5, 74.1, 78.0, 78.5, 82.8, 90.1, 95.7, 121.6, 127.6, 127.7, 127.9, 128.0, 128.1, 128.3, 128.4, 128.5, 135.2, 135.7, 135.8, 136.1, 137.3, 137.5, 138.0, 145.2; ³¹P NMR (202.4 MHz, CDCl₃) δ: -1.484, -1.928, -2.146; HRMS (ESI) mass calcd for C₁₅₈H₁₆₆N₆O₃₉P₆ [M]⁺ 2956.9616, found 2956.9620.

b. Protected triazolophostin dimer 15b:

Click reaction of azide **13** (0.2 g, 0.144 mmol) with diyne **14b** (0.016 g, 0.072 mmol) gave the protected dimer **15b** (0.185 g, 86%) as a colourless gum. ¹H NMR (500 MHz, CDCl₃) δ: 3.44-3.57 (m, 22H, H-2'', H-4'', H-6''_A, and TEG-H), 3.75 (bs, 2H, H-5''), 4.21-4.30 (m, 10H, H-5'_A and PhCH₂), 4.42-4.43 (m, 10H, H-3', H-4', H-5'_B, H-6''_B and PhCH₂), 4.57-4.59 (m, 2H, PhCH₂), 4.64-4.66 (m, 6H, PhCH₂), 4.68-4.73 (m, 4H, PhCH₂), 4.84-4.92 (m, 16H, H-3'', H-4'' and PhCH₂), 5.11 (bs, 2H, H-1''), 5.27(bs, 2H, H-2') 6.24 (d, 2H, *J* = 5.0 Hz, H-1'), 7.00-7.25 (m, 90H, Ar-H), 7.61 (s, 2H, H-5); ¹³C NMR (125 MHz, CDCl₃) δ: 63.2, 67.3, 68.0, 68.3, 68.4, 68.6, 68.7, 69.1, 69.4, 70.9, 72.3, 75.7, 75.8, 75.9, 76.9, 77.5, 81.7, 89.0, 94.7, 120.6, 126.7, 127.0, 127.2, 127.4, 134.2, 134.6, 135.1, 136.3, 136.5, 137.0, 144.2; ³¹P NMR (202.4 MHz, CDCl₃) δ: -1.486, -1.935, -2.155; HRMS (ESI) mass calcd for C₁₆₀H₁₇₀N₆O₄₀P₆ [M]⁺ 3000.9879, found 3000.9877.

c. Protected triazolophostin dimer 15c:

The reaction of azide **13** (0.2 g, 0.144 mmol) with diyne **14c** (0.019 g, 0.072 mmol) gave the protected dimer **15c** (0.175 g, 81%) as a colourless gum. ¹H NMR (500 MHz, CDCl₃) δ: 3.54-3.67 (m, 26H, H-2'', H-4'', H-6''_A, and TetraEG-H), 3.84 (bs, 2H, H-5''), 4.30-4.32 (m, 2H, PhCH₂), 4.37-4.39 (m, 8H, H-5'_A and PhCH₂), 4.48-4.53 (m, 10H, H-3', H-4', H-5'_B, H-6''_B and PhCH₂), 4.66-4.68 (m, 2H, PhCH₂), 4.73-4.74 (m, 4H, PhCH₂), 4.78-4.82 (m, 6H, PhCH₂), 4.92-4.94 (m, 10H, H-3'', H-4'' and PhCH₂), 4.97-5.03 (m, 6H, PhCH₂), 5.20 (bs, 2H, H-1''), 5.36 (bs, 2H, H-2') 6.34 (d, 2H, *J* = 5.0 Hz, H-1'), 7.09-7.34 (m, 90H, Ar-H), 7.75 (s, 2H, H-5); ¹³C NMR (125 MHz, CDCl₃) δ: 64.2, 68.3, 69.1, 69.15, 69.2, 69.3, 69.39, 69.5, 69.5, 69.6, 69.8, 69.9, 70.4, 70.5, 70.55, 71.9, 73.3, 73.5, 76.7, 82.8, 95.7, 121.6, 127.6, 127.7, 127.78, 127.8, 127.9, 128.0, 128.1, 128.3, 128.37, 128.4, 128.5, 128.55, 128.6, 135.2, 136.1, 136.2, 137.3, 137.5, 138.0; ³¹P NMR (202.4 MHz, CDCl₃) δ: -1.468, -1.908, -2.138; HRMS (ESI) mass calcd for C₁₆₂H₁₇₄N₆O₄₁P₆ [M]⁺ 3045.0141, found 3045.0131.

d. Protected triazolophostin dimer 15d:

The reaction of azide **13** (0.2 g, 0.144 mmol) with diyne **14d** (0.026 g, 0.072 mmol) gave the protected dimer **15d** (0.185 g, 82%) as a colourless gum. ¹H NMR (500 MHz, CDCl₃) δ: 3.53 (bs, 34H, H-2'', H-4'', H-6''_A, and HEG-H), 3.74 (bs, 2H, H-5''), 4.23-4.28 (m, 10H, H-5'_A and PhCH₂), 4.42 (bs, 10H, H-3', H-4', H-5'_B, H-6''_B and PhCH₂), 4.56-4.58 (m, 2H, PhCH₂), 4.65-4.71

(m, 10H, PhCH₂), 4.83-4.91 (m, 16H, H-3'', H-4'' and PhCH₂), 5.11 (bs, 2H, H-1''), 5.27(bs, 2H, H-2') 6.24 (d, 2H, *J* = 5.0 Hz, H-1'), 6.99-7.24 (m, 90H, Ar-H), 7.62 (s, 2H, H-5); ¹³C NMR (125 MHz, CDCl₃) δ: 64.2, 69.1, 69.16, 69.2, 69.3, 69.4, 69.5, 69.6, 69.7, 69.8, 69.9, 70.0, 70.4, 70.5, 71.9, 73.3, 73.5, 82.8, 95.7, 127.5, 127.8, 127.7, 127.75, 127.76, 127.8, 127.9, 128.0, 128.1, 128.2, 128.3, 128.4, 128.46, 128.49, 128.5, 128.6, 135.2, 136.1, 137.3, 137.5, 138.0; ³¹P NMR (202.4 MHz, CDCl₃) δ: -1.482, -1.919, -2.168; HRMS (ESI) mass calcd for C₁₆₆H₁₈₂N₆O₄₃P₆ [M]⁺ 3133.0665, found 3133.0669.

3. General procedure for syntheses of triazolophostin dimers 12a-d:

The protected triazolophostin dimers **15a-d** (0.15-0.175 g, 0.05-0.055 mmol) were treated with cyclohexene (3 mL) and Pd(OH)₂ (20% on carbon, 50 mg) in a mixture of methanol and water (9:1 v/v, 10 mL) at 80 °C for 4 h. The reaction mixture was then cooled, filtered through a membrane filter, washed successively with methanol and water. The combined filtrate was evaporated under reduced pressure. The crude product thus obtained was purified by ion-exchange column chromatography on Q-Sepharose matrix using 0 → 1.0 M TEAB as eluent to get pure triazolophostin dimers **12a-d**.

a. Triazolophostin dimer 12a:

The global debenzoylation of **15a** (0.15 g, 0.05 mmol) gave 46 mg (69%) of triazolophostin dimer **12a** as a white hygroscopic solid: ¹H NMR (500 MHz, D₂O) δ: 3.63-3.65 (m, 8H, DEG-H), 3.70-3.83 (m, 12H, H-5'_A, H-2'', H-6'' and DEG-H), 4.09-4.10 (m, 2H, H-5''), 4.41 (bs, 2H, H-4'), 4.48 (bs, 2H, H-5'_B), 4.62-4.65 (m, 6H, H-3', H-3'' and H-4''), 5.16 (bs, 2H, H-2'), 5.24 (bs, 2H, H-1''), 6.36 (bs, 2H, H-1'), 8.22 (s, 2H, H-5); ¹³C NMR (125 MHz, D₂O) δ: 60.1, 60.7, 62.8, 68.8, 69.4, 70.5, 71.5, 72.8, 73.7, 76.4, 77.9, 83.8, 90.9, 97.9, 124.3, 144.1; ³¹P NMR (202.4 MHz, D₂O) δ: 3.504, 3.583, 4.301; HRMS (ESI) mass calcd for C₃₂H₅₈N₆O₃₉P₆ [M]⁺, 1336.1165, found: 1336.1169.

b. Triazolophostin dimer 12b:

The global debenzoylation of **15b** (0.155 g, 0.051 mmol) gave 51 mg (72%) of triazolophostin dimer **12b** as a white hygroscopic solid: ¹H NMR (500 MHz, D₂O) δ: 3.56-3.60 (m, 12H, TEG-H), 3.69-3.74 (m, 12H, H-5'_A, H-2'', H-6'' and TEG-H), 4.06 (bs, 2H, H-5''), 4.36 (bs, 2H, H-4'), 4.44 (bs, 2H, H-5'_B), 4.50-4.60 (m, 6H, H-3', H-3'' and H-4''), 5.12 (bs, 2H, H-2'), 5.18 (bs, 2H, H-1''), 6.31 (bs, 2H, H-1'), 8.18 (s, 2H, H-5); ¹³C NMR (125 MHz, D₂O) δ: 60.1, 60.7, 62.8, 68.8, 69.4, 69.48, 70.4, 71.5, 72.8, 73.7, 76.4, 77.8, 83.8, 90.8, 97.9, 124.3, 144.1; ³¹P NMR (202.4 MHz, D₂O) δ: 3.451 (2 x P), 4.224; HRMS (ESI) mass calcd for C₃₄H₆₂N₆O₄₀P₆ [M]⁺, 1380.1427, found: 1380.1420.

c. Triazolophostin dimer 12c:

The global debenzoylation of **15c** (0.16 g, 0.052 mmol) gave 64 mg (85%) of triazolophostin dimer **12c** as a white hygroscopic solid: ¹H NMR (500 MHz, D₂O) δ: 3.57-3.61 (m, 16H, TetraEG-H), 3.69-3.74 (m, 12H, H-5'_A, H-2'', H-6'' and TetraEG-H), 4.05

(bs, 2H, H-5''), 4.37 (bs, 2H, H-4'), 4.44 (bs, 2H, H-5'_B), 4.58-4.61 (m, 6H, H-3', H-3'' and H-4''), 5.12 (bs, 2H, H-2'), 5.19 (bs, 2H, H-1''), 6.32 (bs, 2H, H-1'), 8.19 (s, 2H, H-5); ^{13}C NMR (125 MHz, D_2O) δ : 60.1, 60.7, 62.9, 68.9, 69.4, 69.5, 70.5, 71.5, 72.8, 73.7, 76.4, 77.9, 83.8, 90.8, 98.0, 124.3, 144.0; ^{31}P NMR (202.4 MHz, D_2O) δ : 3.478 (2 x P), 4.259; HRMS (ESI) mass calcd for $\text{C}_{36}\text{H}_{66}\text{N}_6\text{O}_{41}\text{P}_6$ $[\text{M}]^+$, 1424.1690, found: 1424.1699.

d. Triazolophostin dimer 12d:

The global debenzoylation of **15d** (0.175 g, 0.055 mmol) gave 65 mg (77%) of triazolophostin dimer **12d** as a white hygroscopic solid: ^1H NMR (500 MHz, D_2O) δ : 3.58-3.72 (m, 24H, HEG-H), 3.77-3.81 (m, 12H, H-5'_A, H-2'', H-6'' and HEG-H), 4.01 (bs, 2H, H-5''), 4.38-4.48 (m, 4H, H-4' and H-5'_B), 4.58-4.63 (m, 6H, H-3', H-3'' and H-4''), 5.12 (bs, 2H, H-2'), 5.20 (bs, 2H, H-1''), 6.32 (bs, 2H, H-1'), 8.19 (s, 2H, H-5); ^{13}C NMR (125 MHz, D_2O) δ : 60.2, 60.8, 62.9, 68.9, 69.4, 69.5, 70.8, 71.7, 72.6, 73.7, 76.3, 77.4, 83.8, 90.9, 97.9, 124.2, 144.2; ^{31}P NMR (202.4 MHz, D_2O) δ : 3.482 (2 x P), 4.258; HRMS (ESI) mass calcd for $\text{C}_{40}\text{H}_{74}\text{N}_6\text{O}_{43}\text{P}_6$ $[\text{M}]^+$, 1512.2214, found: 1512.2210.

4. Biological assay:

Ca^{2+} release from the intracellular stores of saponin-permeabilized DT40 cells expressing only type 1 IP_3Rs was measured using a low-affinity Ca^{2+} indicator (Mag-fluo-4) trapped within the endoplasmic reticulum as described previously.¹¹ Briefly, Ca^{2+} uptake was initiated by addition of 1.5 mM MgATP in cytosol-like medium (140 mM KCl, 20 mM NaCl, 1 mM EGTA, 20 mM PIPES, pH 7.0, free $[\text{Ca}^{2+}] \sim 220$ nM after addition of ATP) containing p-trifluoromethoxyphenylhydrazine (FCCP) to inhibit mitochondria. After about 120 s, the triazolophostin analogs were added with cyclopiazonic acid (10 μM) to inhibit further Ca^{2+} uptake. Ca^{2+} release was assessed 10-20 s after addition of the analog, and expressed as a fraction of the ATP-dependent Ca^{2+} uptake.

Acknowledgements

AMV thanks the University Grants Commission (UGC) India for a Senior Research Fellowship (SRF) during this work. KMS thanks Department of Science and Technology (DST) India for Swarnajayanti Fellowship, Ramanujan Fellowship and for financial support. CWT and VK were supported by the Wellcome Trust.
